

Cancer screening

Thanks for bringing your pet in to see us.
We performed a test that screens for common canine cancers.

Test results: Negative for lymphoma and mast cell tumor signals

Your pet's results are negative for lymphoma and mast cell tumor signals at this time. This means that at this time, we don't have a reason to suspect lymphoma or mast cell tumors unless clinical signs develop. That's great news! Cancer screenings are recommended as part of routine wellness exams for dogs aged 7 and older and for higher-risk breeds starting at age 4.

All dogs

High-risk breeds

What does this mean?

Your pet is at an age or is a breed where cancer is more likely to occur.

A negative result for lymphoma and mast cell tumor signals does not rule out other forms of cancer or a cancer diagnosis in the future. Your veterinarian might still recommend additional testing.

It's important to screen your pet for cancer regularly, according to your veterinarian's recommendation.

What can I do next?

As part of caring for your pet's overall health, talk with your veterinarian if you notice any of the following:

- + Unusual lumps and bumps
- + Sores or open wounds that don't heal
- + Weight loss or loss of appetite
- + Vomiting or diarrhea
- + Discharge or odor from the mouth, nose, or anus
- + Lack of interest in exercise and play or decrease in stamina
- + Mobility or stiffness issues
- + Difficulty breathing
- + Difficulty urinating or defecating
- + Any other concerns

By working together, we can help your pet live a long, healthy life.
